

Publication gate: adenoma identity reversal requires two-dimensional evidence

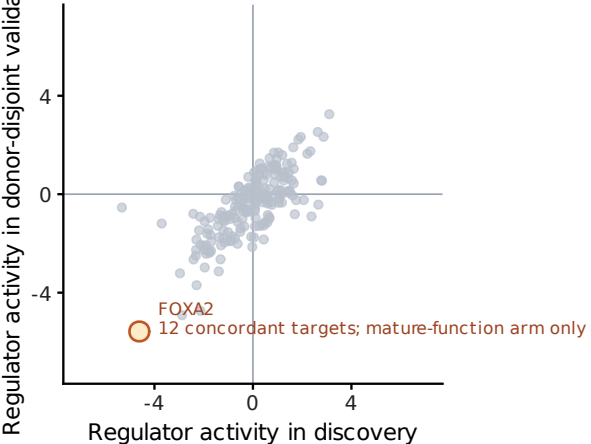

Independent regulator inference, empirical perturbations and a pharmacological screen converge on partial rather than universal reversal

a Existing perturbations separate two response dimensions
Upper right indicates simultaneous WNT/stem suppression and mature-function restoration

● both axes favourable ● mature-function only ● neither axis favourable ● WNT/stem only
○ Single unit ● Multiple units

b Regulator inference yields no balanced two-arm target
201 regulators tested, one replicated regulon (Spearman $\rho = 0.75$)

c A generic perturbation screen finds no recurrent dual-arm hit
95 opposite perturbagens returned by L1000FWD; $q \leq 0.10$ within each query
